

Day3.java assignment:

Create a new repl, name it Day3.

Inside your program do the following:

- Put a comment at the top with your name in it and the date
- Print your name with a `System.out.println()` call.
- Print the following in a single print call. You will need to use escape sequences (what we learned last class) to get this done:

```
/"\  
\"/
```

- Create an integer variable and assign your age to it.
- Create a double variable and store a decimal number between 1000 and 2000 in it.
- Create a boolean variable and store either true or false in it.
- In a single print call print something along these lines that uses each variable in a way that makes sense (feel free to be creative):

```
Mr. Hays  
/"\  
\"/  
I am 57 years old.  
True or False: I have $1492.58 in my wallet.  
Answer: false
```

When you are done, as we did last class, get an Invite link and turn that in on the Google Classroom.
