

Voter Class

Due by Friday 4/23/21 midnight

In the repl I gave you called Day75 Voter, write a class called Voter with the following variables and methods:

Variables:

String firstName

String lastName

int ID (a unique integer id number, starting at 1000; goes up by 1 with each new Voter object created; we do this using a static variable. We covered this in section 5.7 Static Variables.)

The constructor takes two String arguments, the first name and the last name in that order and sets the ID to the next appropriate ID value.

Methods:

int getID() (returns a voter's ID)

String toString() (returns a string that looks like this: "lastName, firstName, ID")

In the main method up top create and print two different Voters. Use the .getID() method with one of the Voter objects in another print call.

Turn a share link in on the Google Classroom. Watch my video if you need help.

Sample output:

Hamilton, Alexander, 1000

Washington, George, 1001

ID: 1001
