day10 weight
Due: Friday 9/8/23

Open a new repl, and write a program from scratch that creates output like this:

```
Welcome to the Mr. Hays weight guesser!
See if you can guess Mr. Hays' weight...

Make a guess (in pounds): 150
 > too low, he's larger than that
Make a guess (in pounds): 200
 > easy there, he's not that big
Make a guess (in pounds): 175
 > that's it, you got it.
```

Write this program from scratch without looking at your old programs. You will need a few print dialogs, a while True loop, an if / elif / else statement, and a break.

This is like a little quiz. Can you do this? If not, open your number guessing program (day4), review what it looks like, and then come back here and keep working on this one. Do NOT copy your number guessing program and try to use it for this program. I want you to write this new program on your own.
